Open Internet Project

5 April 2013

To whom it may concern,

As part of its commitment to ensuring the open development and evolution of the Internet, the Internet Society Bangladesh Dhaka chapter is collaborating with the Internet Society Netherlands Chapter as a project partner of the 'Open Internet' project. We are developing mobile applications on the Android and iPhone platform to be used by the end users to detect illicit port blocking and traffic shaping by the ISPs. Already, we have finished developing the Android version and its been used few thousand times since its launch in last November. However, In order to develop the iPhone versions we needed IOS development and testing environment.

Fortunately, we have received financial support from the Netherlands chapter to buy two Mac-Minis and one iPad mini. These devices are being used by two of our developers at this moment. I am hopeful that within the next few weeks they will be able to deliver the iPhone application. After, they finish developing the final version, the devices will be used by the Internet Society Bangladesh Dhaka Chapter for its official use only. We will be looking forward to projects which will enable us to add features to these application to do various end user network measurements.

We would like to thank the Netherlands chapter specially Mr Alexander Bloom for his continuous support and guidance in this project. We will be looking forward to working more with the Netherlands chapter in the near future.

Sincerely,

Syed Faisal Hasan, Ph.D
Chapter President
Internet Society Bangladesh Dhaka Chapter
